README

1. The python file used to retrieve is retrieval.py
2. It can run through commend line: python retrieval.py (option) documents queries
3. For the commend line, documents is documents.txt and queries is queries.txt
4. The options are:

    -s stop_list.txt   [whether to use stoplist to filter document]

    -i filename   [write results in this file]

    -n number   [retrieving for a specific query, number is docid of query]

    -I   [whether to use NLTK library to process document]

    -A   [retrieving for the full query set]

eg: python retrieval.py -s stop_list.txt -I -i results.txt -A documents.txt queries.txt
This command will retrieve all queries in queries.txt and print results in results.txt
